

Artificial Intelligence (AI) is intelligence demonstrated by machines, as opposed to the natural intelligence of humans. AI research has been defined as the field of study of intelligent agents, which refers to any system that perceives its environment and acts to achieve its goals. The term "artificial intelligence" had previously been used to describe machines that mimic and d. This definition has since been rejected by major AI researchers who now describe AI in terms of intelligent agents. AI applications include advanced web search engines (e.g., Google Search), recommendation systems, and autonomous vehicles.
